

DECODING THE PORTFOLIO ;)

1. Project Setup & Files:

I created a simple folder structure:

- index.html – main page (structure)
- style.css – all styling
- script.js – small interactions (mobile menu, smooth scroll, year in footer)

I used a standard setup for beginner frontend project and this also keeps everything clean!

2. HTML Structure (index.html)

- `<!DOCTYPE html>` – tells browser this is HTML5.
- `<html>` – root element.
- `<head>` – metadata (not visible on page).
- `<meta charset="UTF-8">` – character encoding.
- `<meta name="viewport" ...>` – makes the site responsive on mobile.
- `<title>` – text shown in browser tab.
- `<link rel="stylesheet" href="style.css">` – links external CSS file.

3. Main Sections in the Page

I divided the page into semantic sections so it's easy to read and maintain.

Tags used:

- `<nav>` – semantic tag for navigation.
- `<a>` – links (logo + menu items).
- `<button>` – menu button for mobile.

- `<ul>`, `<li>` – unordered list for menu items.

4. CSS (style.css) – Styling the Page

In style.css, I :

- Reset margins/padding with `* { margin: 0; padding: 0; box-sizing: border-box; }`.
- Defined CSS variables for colors (background, text, accent, card bg, etc.) so it's easy to change the theme later.
- No frameworks used – just plain CSS, which shows I understand the basics well.

5. JavaScript (script.js) – Interactions

In script.js, I added three small features:

- Mobile menu toggle: Uses `document.getElementById` to select elements. Toggles an `.active` class to show/hide the mobile menu.
- Smooth scrolling for anchor links: Selects all links starting with `#`. Prevents default jump and uses `scrollIntoView` for smooth scroll.
- Dynamic year in footer: Automatically updates the copyright year.

6. How I Used Comments:

- These are HTML comments using `<!-- ... -->`.
They:
- Don't show on the page.

- Act as placeholders for me to fill in my own details.
Help anyone reading the code understand where to edit. For CSS/JS, I used `/* ... */` block comments to temporarily disable code while testing.
